

ROGA- cal KT

A corrosion-protection product

Do you have problems with corrosion and calcium build up?

We have the solution for you- Roga-cal KT. This product has been specially developed for application in climate-control, heating and fresh water areas. Older pipes can develop symptoms of corrosion, which can cause serious damage such as bursting pipes.

ROGA-cal KT avoids these symptoms of corrosion by using phosphene salts and polyacrylate.

Dosage is ideally regulated by means of a dosage pump in the fresh water flow, whereby the amount should be measured between 150 and 200 ml per cubic meter of fresh water. Our laboratory will undertake, at your request, an analytical control of your water trace-elements on a regular basis.

You will be able to notice stabilisation of hardness and effects of corrosion protection within a short period of time, when you implement regular dosage. Prevention must be started early. You can, in this way, avoid inconvenient and expensive repair costs.

Just call us if you have questions. We will be able to find a solution together.
