

**The concentrated liquid dosage product for
industrial water systems
ROGA-cal-KTA**

**Do you have problems with calcium build up, corrosion symptoms and
even algae?**

We have the solution for all of your problems: ROGA-cal-KTA.

This product has been specifically developed to be used for wash water and cooling tower water. ROGA-cal-KTA was developed for implementation with wash and/or cooling tower water and is a concentrated dosage product with the following characteristics:

ROGA-cal-KTA binds the hardness elements (calcium) in the water, so that build-up and system break-down can be avoided.

ROGA-cal-KTA keeps the precipitating industrial dust, such as with open cooling towers, in suspension and avoids the caking and/or clogging of equipment.

ROGA-cal-KTA contains a corrosion protection product and avoids symptoms of corrosion in metal components.

ROGA-cal-KTA avoids, over the long-term, growth of algae and bacteria, which was been confirmed by the Degussa AG in a lengthy analysis.

Application: Dosage of ROGA-cal-KTA ensues by means of a dosage pump in the fresh water flow. The amount is determined by the degree of hardness of the water and should be measured between 200 and 500 ml per cubic meter.
