

# **ROGA- cal T**

## **A corrosion-protection product and hardness stabiliser**

---

**This product has been specially developed for application in the area of drinking-water. Older water-supply pipes can develop corrosion, which can seriously influence water quality. ROGA cal T prevents this development of corrosion by using mono- and poly-phosphates. These build an extremely thin protective layer on the inner surface of the pipes, effectively preventing the development of corrosion.**

**Our product can be, according to TVO-specifications introduced without hesitation into food product areas and drinking water areas.**

**ROGA-cal T is stable up to temperatures of 65° C. Dosage is ideally regulated by means of a dosage pump in the fresh water flow, whereby the amount should be measured between 12 and 15 ppm/l.**

**(Come to us with your questions before it's too late!)**

**A long storage period should be avoided with this product, since the mixed phosphate-chains can hydrolyse after long-term disuse. If questions should arise, we are at your disposal at any time.**
